Devops and SRE Maturity Compass

SRE Maturity Assessment

Domain: **Banking** | Maturity Score: **51%** | Maturity Level: **Managed**

Module

Infrastructure as Code

Excellent

• NA

Good

• Integrate KPIs such as lead time MTTR and success rate into dashboards Grafana PowerBI Datadog review periodically.

• Automate success/failure tracking in CI/CD tools and visualize trends in dashboards Datadog Grafana Jenkins.

Needs Improvement

• Implement structured RCA for CI/CD failures document findings and feed back into pipeline improvements.

• Standardize environments using IaC and configuration management (Terraform Ansible) implement drift detection and remediation.

• Set up automated compliance enforcement and drift tracking; report findings via dashboards (Grafana Datadog Security Hub).

Operational Tooling

Excellent

• NA

Good

• Standardize dashboards and alert templates across teams using Grafana DataDog or Prometheus Alertmanager automate alert tuning via SLO/error-budget alignment.

• Improve automation by converting scripts into scheduled workflows using Airflow Rundeck or GitHub Actions enforce logging and auditability.

Needs Improvement

• Establish a KPI review process using scheduled reports from Datadog/Grafana integrate incident data and SLO performance into dashboards.

Monitoring & Observability

Excellent

• Dashboards are standardized well-structured and accessible to all relevant teams ensuring shared visibility and alignment on system performance. This supports faster collaboration and decision-making. Even Better If: Dashboards are managed as code versioned and automatically deployed using GitOps practices.

• Monitoring data is retained for sufficient duration to support meaningful trend analysis capacity planning and reliability improvements. This enables informed long-term decision-making. Even Better If: Historical data is actively used to drive forecasting

Good

• Integrate drift detection and remediation using Terraform Cloud Spacelift or AWS Config Rules.

• Automate reporting with dashboards integrating Terraform/CloudFormation coverage and compliance checks.

• Optimize pipelines using Terraform Cloud run metrics GitLab CI/CD timing analytics or ArgoCD logs implement caching and parallelization.

Needs Improvement

• NA

CICD & Automation

Excellent

• CI/CD failures are consistently analyzed through structured root-cause analysis demonstrating a strong learning culture and commitment to continuous pipeline improvement.Even Better If: You further accelerate learning by automating RCA summaries and sharing insights across teams through internal knowledge bases or engineering reviews.

• Your deployment pipeline demonstrates a high level of maturity with seamless end-to-end automation from build through release. This reflects strong engineering discipline; reduced human error and fast; reliable delivery. Even Better If: You continue optimizing pipeline performance by reducing execution time; adding parallel test stages; and periodically reviewing pipeline efficiency and cost optimization (e.g. runner utilization; caching strategies).

Good

• Enhance rollback strategies using Spinnaker Argo Rollouts or GitLab/CD blue-green/canary deployments with automated verification.
• Define risk-based approval gates using GitHub Environments GitLab Protected Environments or Jenkins input steps.
• Automate success/failure tracking in CI/CD tools and visualize trends in dashboards (Datadog Grafana Jenkins).

Needs Improvement

• NA

Site Reliability Engineering

Excellent

• Playbooks are comprehensive updated and actively referenced during incidents. Continue maintaining currency after every major change.

Good

• Automate error budget tracking via DataDog New Relic or Dynatrace Link threshold breaches to change-freeze workflows in Jira or ServiceNow.
• Use incident analytics tools (PagerDuty Insights Opsgenie Analytics) to automatically compute MTTR.

Needs Improvement

• Establish SLIs based on real user monitoring metrics implement SLO dashboards using Grafana + Prometheus integrate SLO checks into CI/CD pipelines via GitHub Actions / Jenkins gates.
• Establish structured review rituals create automated quarterly reports using DataDog/Grafana and integrate review cycles in Confluence.

Security

Excellent

• NA

Good

• Extend scanning to container images and IaC templates using Trivy Checkov or Terraform Cloud’s built-in policy checks.
• Expand automation using policy-as-code frameworks (OPA HashiCorp Sentinel) and enforce mandatory security checks in pipelines.
• enabling early detection and rapid remediation of risks. This reflects mature vulnerability management practices. Even Better If: Scanning includes SBOM validation and runtime security monitoring to extend

coverage beyond build time.

Needs Improvement

• Implement automated compliance tools (Prisma Cloud Wiz Lacework) and establish regular report generation integrated with Jira/Confluence.

• Add automated SAST/DAST checks (OWASP ZAP CodeQL) introduce pipeline-level blocking on critical or high vulnerabilities.

Reporting & Compliance

Excellent

• NA

Good

• Enhance automation using tools like HashiCorp Sentinel OPA (Open Policy Agent) or GitLab Compliance Pipelines to export structured compliance evidence.

• Improve audit accuracy with CloudTrail Azure Activity Logs or GCP Audit Logs forward logs to SIEM for correlation.

• Strengthen policy enforcement using Conftest + OPA Terraform Cloud Policy Sets or Gatekeeper for Kubernetes.

• Integrate compliance KPIs into dashboards using PowerBI Looker or Grafana Enterprise and automate updates.

• Automate SLA tracking in Jira/ServiceNow using workflow rules and escalation policies.

Needs Improvement

• NA

Initial

The environment lacks alignment with DevSecOps best practices, resulting in manual bottlenecks and high operational risk.

Managed

Core best practices are present, but execution is inconsistent and requires structural maturity to scale.

Measured

Industry best practices are integrated with robust tooling and telemetry, enabling objective performance tracking.

Optimised

The system operates with peak efficiency, leveraging advanced DevOps methodologies and continuous security compliance.
